

COLOR

For each color, list emotions, moods, images, or ideas that you envision when you think of it.

RED

ORANGE

YELLOW

GREEN

BLUE

VIOLET

BLACK

WHITE

BROWN

# RED

- Happy
- Affectionate
- Loving
- Exciting
- Striking
- Active
- Intense
- Powerful
- Masterful
- Strong
- Defiant
- Aggressive
- Hostile

# Orange

- Warm
- Hot
- Happy
- Disturbed
- Merry
- Distressed
- Exciting,
- Unpleasant
- Stimulating

# Yellow

- Stimulating
- Cheerful
- Exciting
- Joyful
- Serene
- Unpleasant
- Aggressive
- Hostile

# Green

- Youthful
- Fresh
- Leisurely
- Secure
- Calm
- Peaceful
- Emotionally Controlled
- Ill
- Wealthy
- Envious

# Blue

- Pleasant
- Cool
- Secure
- Comfortable
- Tender
- Soothing
- Intelligent
- Social
- Dignified
- Full
- Great
- Strong
- Sad

# *Violet*

- Spiritual
- Dignified
- Stately/Royal
- Vigorous
- Disagreeable
- Melancholy
- Despondent
- Unhappy
- Depressing
- Sad

# Black

- Sad
- Melancholy
- Vague
- Unhappy
- Fearful
- Old
- Heavy
- Distressed
- Dignified
- Stately
- Strong
- Powerful
- Glamorous

# White

- Purity
- Innocence
- Tender
- Soothing
- Solemn
- Empty
- Sterile
- Unfriendliness
- Coldness
- Barred (Barriers)

# Brown

- Secure
- Comfortable
- Reliable
- Earthy
- Full
- Sad
- Dirty
- Disagreeable
- Lack of Sophistication

# Color Terminology

- **Color**—brought to you by light! Light waves of a certain length stimulate retina (in eye) which signals to the brain what we perceive as color.
- **Hue**—quality that differentiates one color from another (ex-blue vs. green vs. yellow)
- **Saturation**—amount or percentage of a hue in a color mixture. (ex-fire engine red=high saturation, dusty rose=lower)
- **Value**—relative lightness or darkness of color. (ex powder blue=high value, dark brown=low value)
- **Tint**—color with a high value. Usually achieved when mix color with white (light)
- **Shade**—color with low value. Usually get from mixing one or more hues and black.

# Primary Colors

- Red, Yellow, Blue
- Can't be made/blended from any other colors.

# Secondary Colors

- (These function differently when working with light—just know that...)
- Secondary colors are made by mixing two primary colors
  - In pigment (not light), the colors made are Purple (or Violet), Green, & Orange.

**Complementary Colors**

# I GET IT!!!

## Color communicates. So what?

- How can a designer manipulate the audience's perception of the colors they'll see onstage?

# Manipulation 101

- There are general “rules” of color use that artists and designers abide by.
  - For example: Set designs often done in medium saturation. This allows the set to fade a bit more into the background where it can support the storytelling coming through the costumes, lights, sound, etc....
  - Costume—often more free with their color saturation and choices, because costumes draw attention to the **characters**. Main rule for costume design is that color choices should support the character (or the version you want to portray).
- However! Really good designers know how to break rules in a way that can support a concept.

# Manipulation 101

- Color Proximity– The placement of one hue in relationship to another.
  - How far apart or close together colors are, etc...
- Manipulation Hint: The spatial relationships between specific hues (especially contrasting colors) have a great impact on an audience's perception of a scene!!

# In your scripts...

- What is the environment of your play?
  - Is it one location the whole time? Several?
- Do you want your characters to stand out more or their environment?
- What color choices could you make with your set to support the things you want to emphasize?
- What moods do you want to establish? What colors capture that mood? Why?

# Terra Nova Color Analysis

- Environment of the Play: “Frozen whiteness of Antarctica” is the primary location
